

Figure 1. A schematic diagram illustrating the experimental design. The figure shows a sequence of events starting from a participant's arrival at the laboratory. The participant is first informed about the experiment and then given a practice trial. This is followed by three main trials: a baseline trial, a treatment trial, and a follow-up trial. Each trial involves a series of steps: a pre-test, a test, and a post-test. The treatment trial includes a specific intervention phase. The entire process is monitored by a researcher who records the participant's performance and physiological responses throughout the study.
